GENERATION BY SOURCE, 2016

WIND AND SOLAR NET ELECTRICITY GENERATION GROWTH IN CANADA, 2005 - 2016 (in GWh)

Smart Grid Deployment Metrics in Canada 2018

In 2016, **81%** of electricity in Canada came from **non-GHG emitting sources**

SOLAR PV

2.10 GW_{AC}
distributed out of
2.48 GW_{AC}
installed grid-connected capacity

Data as of December 31, 2017

EV

72.8 k
BEVs and PHEVs
on road

>5.8 k
Level 2
charging outlets

>850
Level 3
charging outlets

Data as of July 31, 2018

SMART METER

>81%
of meters are smart

Data as of August 17, 2018

WIND

0.96 GW_{AC}
distributed* out of
12.70 GW_{AC}
installed capacity

*assuming all wind capacity below 20 MW is distribution connected

Data as of July 1, 2018

Canada 

Role of Load Flexibility

- Traditionally, approaches to balance supply and demand consist of
 - Dispatching generators
 - Buying energy on the electricity market
- Now, demand - enabled by the smart grid - can be a new source of flexibility
- Flexible loads can shift their demand (ideally with little or no effect on user comfort)

Smart Thermostats Pilot Program

Objective: Assess the potential of smart thermostats controlling electric baseboard heaters for peak shaving, while exploring impacts on

- utility demand
- energy consumption
- participant comfort

Thermostat Pilot: Setup

The energy detective (TED)

- Measures home power consumption
- Reports every minute

Caleo thermostats

- Approx. 100 thermostats in 11 homes
- Remotely modulate temperature setpoint
- Report monitored data every 5 minutes (measured room temperature, setpoint temperature)

Caleo dashboard

- Defines thermostat setpoints

Summerside Smart Grid Project for Wind Integration

Summerside, PEI

- 15,000 inhabitants
- 27 MW peak
- 130 GWh annual energy consumption

Electric utility

- Municipally-owned
- 21 MW wind generation
- Wind represents 46% of the electricity production
- Interconnected with NBPower

City of
Summerside

Prince Edward Island

S. Wong, G. Gaudet and L. P. Proulx, "Capturing Wind with Thermal Energy Storage – Summerside's Smart Grid Approach," in *IEEE Power and Energy Technology Systems Journal*, In Press. doi: 10.1109/JPETS.2017.2754139

Wind Integration Challenge

- Mismatch between wind and load means that energy must often be exported to bulk grid
- Consequences:
 - Lost GHG reduction potential with clean energy not being used locally
 - Missed economic gains by exporting the wind energy at less than value

© Her Majesty the Queen in Right of Canada, as represented by the Minister of Natural Resources, 2018

Solution

Solution:

- A *smart grid* program increasing local utilization of wind generation

Since wind cannot be controlled (without losing energy), solution must be on the load side

Approach:

- Increase electric heat load
- Enable flexibility in heat load through utility managed heat energy storage
- Use wind energy to heat or to charge energy storage appliances for space/water heating

High temperature electric water heater with thermostatic valve

Program

Consumer-side Program:

- Encourage replacement of oil-fired equipment with
 - Electric thermal storage (ETS) space heating units
 - High capacity/temperature electric water heaters
- by offering discounted rates
 - Offsetting customer-borne capital costs
 - Bucket at 8¢ vs 12¢ per kWh for appliance energy demand
- Appliance load management options
 - Smart (dynamically)
 - Time-of-use

Total device uptake, to 2015

Device	No.	Total Charging Capacity (kW)	Total Storage Capacity (kWh)	Estimated Energy Use (MWh)
Room ETS	120	642	3240	1436
House ETS	45	1244	6618	2153
ThermElect Large ETS	6	480	2280	2997
Water Heater	140	630	849	n/a

Total of 3 MW and 13.5 MWh of available storage

Results

- Additional 621 MWh (24% of surplus) of wind locally consumed
- 400 t CO₂eq GHG avoidance

Portion of energy use supplied by wind, per device

ToU ETS (small home)	Smart ETS (small home)	ToU EWH
2.4 t CO ₂ eq/y/appliance	2.9 t CO ₂ eq/y/appliance	0.3 t CO ₂ eq/y/appliance

© Her Majesty the Queen in Right of Canada, as represented by the Minister of Natural Resources, 2018

Conclusion

- The transition to a smarter grid has already begun
- Challenges remains to seamlessly integrate all smart grid components (renewable energy, flexibles loads, microgrids, demand response)
